Profile

I am a fourth-year Software Engineering student at the Faculty of Computer Science and Engineering, that has always loved the blend of creativity and logic that comes with writing code. Lately, I have become incredibly fascinated by data science and how fast the field is moving. I am the type of developer who loves jumping into new technologies, figuring out how they work, and using them to build better applications.

Education

Faculty of Computer Science and Engineering

Skopje Oct 2023 – present

SOU Gimnazija "Josip Broz Tito"

Bitola Sept 2019 – June 2023

Experience

Laboratory Teaching Assistant, FCSE

Skopje Oct 2025 – May 2026

This rewarding role challenged me to think creatively and assist fellow students in their coding journeys. By helping with courses in Object-oriented Programming, Web Design, Client-Side Internet Programming, and Internet Technologies, I significantly strengthened my core skills and built leadership and communication confidence.

Vezilka AI Factory Antenna

Skopje Jan 2026 – Sept 2026

Collaborated with a small team to design and build an automated system for course creation. My focus was on leveraging n8n to architect efficient workflows that streamline content generation and system integration—a project that pushed me to think critically about system design and data pipelines.

Projects

Portfolio Page

`https://isidorakuzmanovska.vercel.app/`

This project is a personal portfolio website built with Astro, a fast modern framework for content-driven sites. It also uses Tailwind CSS for styling, with a Vercel-ready setup for deployment.

Tags: Astro Tailwind CSS Vercel

Image Crawler

`https://github.com/isidoraisidora/image-crawler`

A collaborative Web Programming project where I built the core crawling system. Using FastAPI, I developed an on-demand crawler hooking into the Pexels API to fetch images based on user prompts, routing them through Salesforce's BLIP model to auto-generate AI-driven captions and search tags. Users can also provide a direct URL; the system scrapes images and checks for HTML alt tags, generating captions via BLIP if missing.

Planka Kanban: DevOps Implementation

`https://github.com/isidoraisidora/planka-kanban/`

Designed and implemented an end-to-end DevOps pipeline for Planka, an open-source Kanban application, taking it from source code to production, for my CI/CD course. Containerized the multi-service stack (Node.js, PostgreSQL, Redis) with a multi-stage Docker build and Docker Compose, and automated delivery with GitHub Actions, so each push to master builds the image, publishes it to Docker Hub and deploys to Render. Also deployed the application on Kubernetes using Deployments, Services, Ingress, ConfigMaps, Secrets and a PostgreSQL StatefulSet with persistent storage.

DocuMind: RAG Question-Answering System

https://github.com/isidoraisidora/documind

Built an end-to-end Retrieval-Augmented Generation application that lets users ask questions over their own documents and receive grounded, source-cited answers. Developed the backend as a FastAPI service that handles document ingestion, chunking and embedding, stores vectors in pgvector, and retrieves relevant passages to pass to an LLM for answer generation. Containerized the full stack (API, vector database, frontend) with Docker and Docker Compose, automated testing, image builds and delivery with GitHub Actions, and deployed the system on Kubernetes using Deployments, Services, Ingress, ConfigMaps, Secrets and persistent storage.

Movie Recommender Model

https://isidoraisidora.github.io/movie-recommender-model/v2-movie-recommender/

An enhanced Content-Based Recommender System, that takes as input a movie title and returns five other movies that are similar, built with Python, Pandas, and scikit-learn. Extracts and cleans text data from the TMDB 5000 dataset—overviews, directors, cast, keywords—converting them into high-dimensional vectors via CountVectorizer and Cosine Similarity to yield nuanced, accurate film recommendations.

Email Summarizer

https://github.com/isidoraisidora/email-cleaner

Developed an automated Python application that fetches weekly emails via the Gmail API, parses and cleans their content, and uses the Groq API (Llama 3.3 70B) to generate structured summaries. Automatically formats and emails a categorized digest (Needs Attention, Important Updates, FYI) back to the user via SMTP.

Skinventory App

https://github.com/isidoraisidora/skinventory-app

Built a multi-project ASP.NET Core (.NET 10) web application for skincare inventory management and product reaction tracking. Integrates a daily Quartz.NET ETL pipeline querying Open Beauty Facts to seed product and ingredient data, custom JWT authentication, an asynchronous System.Threading.Channels queue for email reminders, and PAO-aware expiration tracking. Containerized the application with a multi-stage Docker build and a persistent volume for the SQLite database, and automated testing, image builds and publishing to a container registry with GitHub Actions.

Misi Store - Second Hand Shop

https://misi-store.vercel.app/

Built a full-stack e-commerce site for my Instagram-based secondhand clothing shop, migrating 280 existing product listings (images, prices, descriptions) from Instagram into a structured Supabase database, then building a React storefront on top of it with Next.js. Designed the product and order data model in PostgreSQL, implemented server-side order validation, transactional inventory locking via Postgres functions, and automated email notifications (order confirmation to the customer, new-order alerts to the shop owner) all deployed on Vercel.

Pocket - Personal Budget Tracker

https://pocket-budget-tracker.vercel.app//

Developed a full-stack personal finance web application using Next.js (App Router), React, TypeScript, and Tailwind CSS, featuring responsive interfaces for income and expense categorization, budget goal tracking, and real-time updates. Utilized browser LocalStorage for fast, lightweight data persistence without a traditional backend database.
